

Abilisoft - The modern alternative to the forced migration of IBM Tivoli Netcool SSM agents to ITM agents

- Are you faced with a migration from Tivoli Netcool SSM agents and do you believe that you are simply replacing one old agent technology with another?
- Do you think the migration of your Tivoli Netcool SSM agents to ITM agents will provide no marked new functional improvement, nor drive down your existing operational costs?
- Will you be able to easily manage and centrally administer your new ITM agents without making changes to your existing software and hardware architecture?
- Will the new ITM agents require less man hours to configure and maintain, than the SSM agents?

Abilisoft - The global leader in agent technology innovation

Organisations faced with a "forced migration" of their existing Tivoli Netcool System Service Monitor (SSM) Agents no longer have to migrate simply to run the agent software (i.e. "IBM Tivoli Monitoring (ITM) Agents) dictated by the vendor as their supported path, which upon migration provides no marked functional or operational improvement. Instead, Abilisoft offers a viable modern alternative that adheres to good IT engineering best practice; older technology should only be replaced with newer technology, if it can be proven to improve the effectiveness of the existing monitoring tools and process already in operation, and also reduce operational cost enough to provide a respectable ROI with minimal risk. The Abilisoft alternative achieves this because:

Abilisoft's cutting-edge agent technology installs seamlessly into the existing

environment, and is unique in its ability to replace an organisation's existing Tivoli Netcool SSM agent layer, with zero impact on the performance and continuity of the management layers above (e.g. the Netcool ObjectServer). This is achieved because Abilisoft has created **the world's first "abstraction layer"** between the traditional proprietary manager and agent architecture of today's monitoring solutions, providing organisations with the flexibility of choice to actually monitor **what they want, in a way that they want.**

The abstraction layer is a result of Abilisoft's "agnostic" agents that have been specifically designed to be seamlessly implemented into any existing monitoring solution within the organisation's IT infrastructure, without requiring changes to the complex management layers above, in which

companies have invested substantial time and money building and implementing their complex business logic (i.e. rules, service models etc.). Abilisoft empowers organisations to bypass this standard proprietary relationship, and thereby gives customers the opportunity to replace old outdated and underperforming software agents with Abilisoft's leaner, more functionally performant and more cost effective agents, in a risk free, controlled transformation process.

Abilisoft improves operational efficiency through enhanced levels of automation coupled with proactive agent technology, saving time and improving business processes.

To discuss the implications of your forced migration, and to learn how other organisations have benefited from this unique alternative, please email:
